

ROOTSIGNING

Trusted Roots for Your Company

RootSigning – for Global Acceptance of Your Corporate Certificates

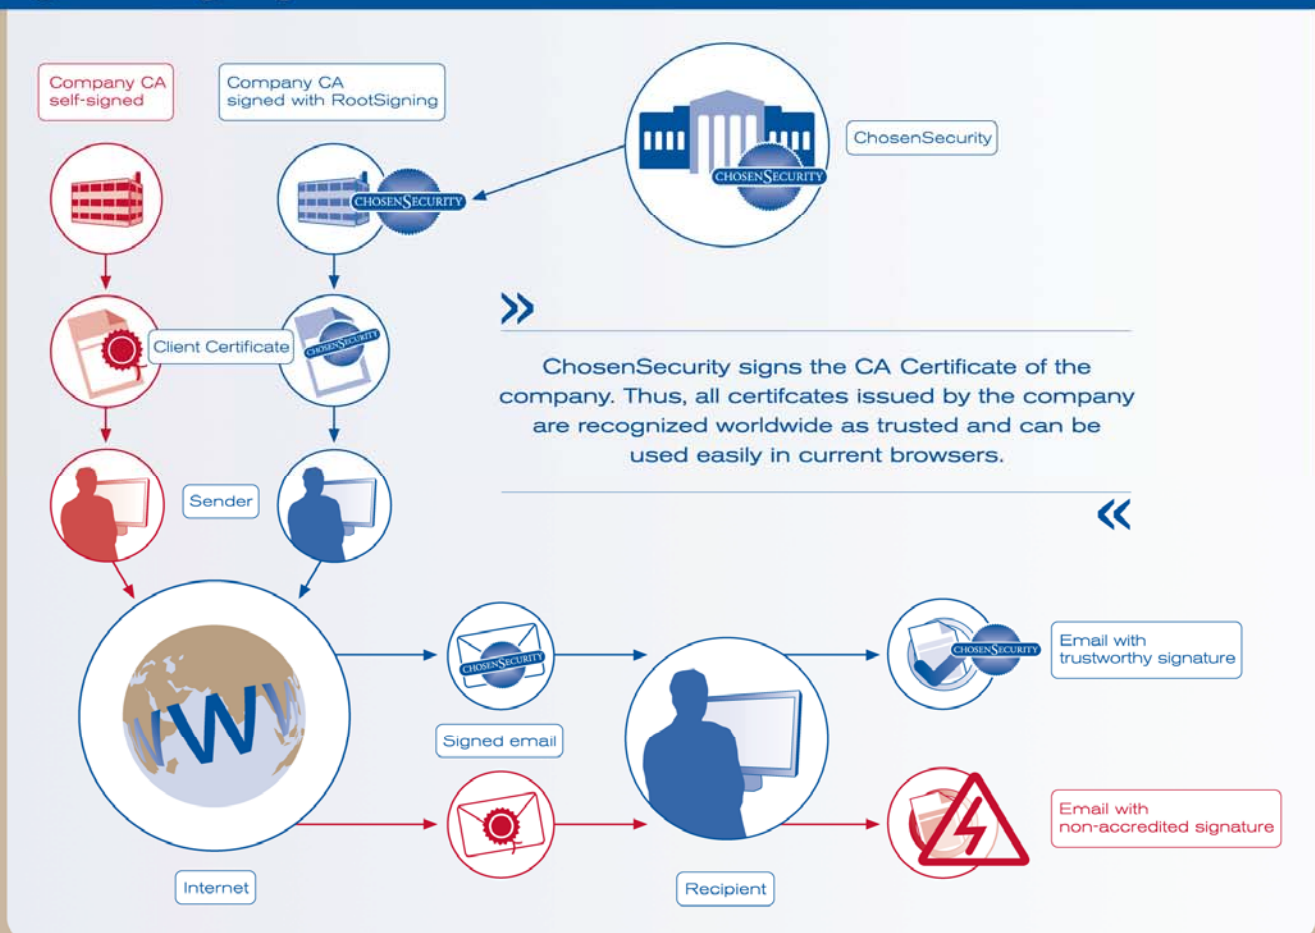

Your company operates its own Certificate Authority (CA) and provides both employees and partners with certificates for protected electronic communications and secure transactions. Your goal is trouble-free deployment of your certificates for everyone involved in your Public Key Infrastructure (PKI). With RootSigning, you easily achieve trusted status for your certificates worldwide and ensure their acceptance by 99% of all browsers.

Electronic Certificates are the Basis for Secure E-Business

Certificates enable secure and trusted electronic communication. Many applications support the use of certificates for both signing and encrypting email and documents. Furthermore, they allow authenticated access to things like applications and online services. In order for the certificates issued by you to be universally accepted, however, it is imperative that the applications used recognize your corporate CA. This is the only way for certificates to be automatically categorized as trusted, thus avoiding related error messages.

Self-signed corporate certificates are not automatically recognized by applications, and must therefore be specially installed. Only CA certificates issued by globally-recognized certificate authorities, such as ChosenSecurity, are integrated in applications as standard. RootSigning offers you the solution with no additional effort: We sign your company's CA certificate for you. As a result, all certificates issued with your CA certificate are recognized worldwide as trusted, and thereby enable the seamless use of certificate-based applications.

RootSigning Creates a Chain of Trust

ROOTSIGNING

Trusted Roots for Your Company

Features & Benefits

- > Corporate CA signed by a globally-recognized CA (integrated in more than 99% of standard browsers)
- > Issuance of gateway and user certificates in your company's own name for employees and business partners
- > Prevents need for company-wide installation of own CA certificates in browsers
- > Control over CA and processes remains within your company

Supported Applications

ChosenSecurity's CA certificates are pre-installed in all standard browsers and are compatible with most certificate-based intranet and Internet applications, including email and VPN. That means that companies with their own CA certificates signed by RootSigning can issue digital certificates for employees, business partners and networked companies, which are recognized and accepted around the world.

Trust Thanks to Established Certification Policies

The trusted status of ChosenSecurity's CA certificates is based on globally-recognized and proven certification policies. With RootSigning, you assume these policies, and thereby lay the foundation for a universally-recognized and trusted corporate CA at the same time. This is a significant benefit to your organization.

You Retain Control of Processes

RootSigning enables companies to retain control over registration activities, including issuance, renewals and suspensions. All processes – from registration and applicant authentication, to certificate creation and administration, all the way to distribution of the public key – remain in your company's responsibility. This ensures, for example, that information about employees stays inside your company, and that internal workflows can be designed flexibly.

Security for Your Certificates and Your Company

RootSigning gives you the option of issuing certificates in your own name, while at the same time benefiting from all the advantages of a pre-installed, trusted root. With your own trusted and globally-accepted certificates, your company can establish a solid reputation in dealing with security-related processes and build up its own network of trust.

The Advantage of Working with ChosenSecurity

ChosenSecurity, Inc. is a leading specialist for identity verification and security services, ensuring safe and secure online communication and transactions. The company has offered certificates and security solutions along the entire value chain of identity verification. The product portfolio ranges from client certificates enabling secure communication, encryption of transactions and data, secure access to applications and data, reliable authentication and managed security services, to complex PKI and SmartCard solutions.
